

My Twelve Week Productivity Plan

This timeline combines a two-week audit with a 12-week forward plan to improve consistency and productivity. The audit showed that most of my time was spent on sleep, personal tasks, and coursework such as data cleaning and visualisation; however, efficiency was reduced by frequent task switching and irregular working patterns. On average, I completed around 10-12 hours of study per week, which highlighted the need for a more structured and focused approach to academic work. In response, I developed a weekly schedule that protects approximately 20 hours for CariSurg, organised into consistent 3-5 hour study blocks across both weekdays and weekends, with weekends also allocated for assignment completion and review. To support sustained focus, I apply the Pomodoro Technique, using structured work intervals and short breaks to improve concentration and reduce mental fatigue. Overall, this plan directly addresses the inefficiencies identified in my audit by reducing fragmentation of work, improving structure, and establishing consistent study habits that support sustainable performance and steady progress across the 12-week period alongside other commitments.
